Double Blind Review | Rebuttal

Double Blind Review

Overall Score

Accept. Good quality paper that meets the conference standards. Minor improvements may be needed. 3

Relevance to the Conference

Excellent.

The manuscript is highly relevant to the conference scope, particularly in Information Retrieval, Recommender Systems, Artificial Intelligence, and Content-Based Recommendation.

Contribution and Originality

Fair.

The paper proposes a second-order accord co-occurrence representation as an extension of conventional TF-IDF for interaction-free perfume retrieval. While the proposed representation is interesting and computationally lightweight, the methodological novelty is relatively limited.

The contribution is demonstrated only within a relatively small proprietary perfume catalog (340). The manuscript does not establish whether the proposed representation generalizes to broader recommendation or information retrieval problems.

Structure of the Paper

Excellent.

The paper is logically organized and follows a clear research structure. The research questions, methodology, experiments, results, and conclusions are presented coherently.

Standard of English

Good.
The clarity, vocabulary, and scholarly tone are of a high standard. Technical concepts are explained concisely and without ambiguity. However, several sentences are unnecessarily long and contain dense technical descriptions that reduce readability.
for example (in abstract): "...These results imply that a lightweight and transparent method is sufficient for recommending within catalogs that carry no user data, which makes it deployable in stores where staff face peak-hour queues, and the shared accord pairs behind each recommendation can be surfaced directly as an explanation to the customer..."
--> consists of at least 3 different claim. It would be better if rewrite into 3 different sentences.

Appropriateness of the Research/Study Method

Good.
The experimental methodology is comprehensive and carefully designed. The inclusion of statistical significance testing, bootstrap confidence intervals, leave-one-out evaluation, and a label-circularity audit demonstrates methodological rigor. However, several important weaknesses remain. The experiments rely entirely on a single proprietary dataset consisting of only 340 products. Consequently, the external validity of the proposed method is limited.

Relevance and Clarity of Drawings, Graphs, and Tables

Excellent.

The figures and tables clearly illustrate the proposed methodology and experimental findings. The workflow and interaction-order illustrations are particularly useful for understanding the proposed representation.

Appropriateness of the Abstract as a Description of the Paper

Excellent

The abstract provides a clear, balanced summary of the cold-start problem, proposed method, dataset size, baseline comparisons, key empirical gains, label-audit findings, and practical deployment implications.

Use and Number of Keywords/Key Phrases

Excellent

Keywords (recommender systems, content-based retrieval, co-occurrence, TF-IDF, cold start, interaction-free, fragrance) accurately represent the domain and scope.

Discussion and Conclusions

Good.

The conclusions are supported by the experimental results, and the limitations are appropriately acknowledged. However, the discussion focuses primarily on experimental observations rather than broader scientific implications.

Reference List

Excellent.

The reference list is comprehensive and includes recent literature from recommender systems, information retrieval, graph learning, and perfume recommendation.

Overall Recommendation

Accept but with major revision.

Although the manuscript is technically sound and experimentally rigorous, its scientific contribution is currently insufficient. The proposed second-order accord co-occurrence representation represents an incremental extension of conventional TF-IDF rather than a substantial methodological innovation. The evaluation is restricted to a single proprietary dataset, limiting the generalizability of the findings.

Things to be improved:
1. Make the broader scientific contribution beyond the perfume recommendation domain.
2. Validate the proposed method on additional datasets or demonstrate applicability to other content-based recommendation problems.
3. Expand the discussion on practical and theoretical implications, explaining when the proposed representation should be preferred over existing methods.

Accept. Good quality paper that meets the conference standards. Minor improvements may be needed. 3

Relevance to the Conference

Excellent. Strong fit with information retrieval, recommender systems, and AI.

Contribution and Originality

Good. The proposed representation is meaningful, but the novelty of the proposed second-order accord representation could be positioned more clearly with respect to existing perfume retrieval literature. A more explicit discussion of how previous retrieval methods represent perfume accords, supported by relevant references, would better highlight the originality of the proposed approach.

Structure of the Paper

Excellent. Well organized with clearly defined research questions and logical progression.

Standard of English

Excellent. Clear and easy to follow.

Appropriateness of the Research/Study Method

Good. Comprehensive evaluation protocol with appropriate retrieval metrics, statistical significance testing, cross-validation, and circularity audit.

Relevance and Clarity of Drawings, Graphs, and Tables

Excellent. Figures are clear and effectively explain the methodology.

Appropriateness of the Abstract as a Description of the Paper

Excellent. Accurately summarizes the motivation, method, and findings.

Use and Number of Keywords/Key Phrases

Good. Appropriate and representative.

Discussion and Conclusions

Good. Thorough discussion with appropriate interpretation of results and transparent acknowledgment of limitations.

Reference List

Good. Generally relevant and current. However, additional references discussing representation strategies in perfume retrieval would further strengthen the positioning of the proposed contribution.

Overall Recommendation

Accept with some suggestions of improvement:
1. Strengthen the discussion of novelty by more explicitly positioning the proposed second-order accord representation with respect to previous perfume retrieval methods and supporting this discussion with additional related literature where applicable.
2. Expand the discussion on why second-order representation provides the best trade-off compared with higher-order representations beyond the reported experimental observations.
